

Emissions from Waste from Veitur Utilities' Operations

The following graphs display the goals and estimated actual emissions from waste coming from Veitur's operations from 2015 – 2030 and Veitur's level of achievement towards these goals. In 2018, emissions were significantly above the 2015 baseline, and even on a per-employee-basis emissions were still above, though much closer, to the 2015 baseline. Emissions from waste are calculated according to the category of waste (e.g. general waste, paper, plastic, etc.), the quantity of this category, and an estimate of how this waste is treated (e.g. landfilled vs. recycled). The emission factors for these different treatment options and waste categories are derived from the U.K. Energy Agency.
